Low frequency, Surgery.

An electric method of producing surgical anesthesia by
low-frequency and low-intensity alternating current
is described. The method consists in increasing the
current very slowly after the test animal has been
prepared with barbiturates. It is believed that it is a
question of exciting the diencephalic sleep center. By
reducing the excitation of the motor and tonic centers
(Biological Sciences--Surgery, TT, v. 9, no. 12).
